# Motion field

 The motion field is the projection of the 3D scene motion into the image

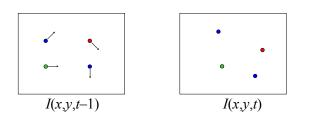

# Optical flow

- **Definition**: optical flow is the apparent motion of brightness patterns in the image
- Ideally, optical flow would be the same as the motion field
- Have to be careful: apparent motion can be caused by lighting changes without any actual motion
  - Think of a uniform rotating sphere under fixed lighting vs. a stationary sphere under moving illumination

# Estimating optical flow

• Given two subsequent frames, estimate the apparent motion field u(x,y) and v(x,y) between them

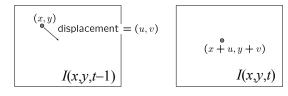

- Key assumptions
  - Brightness constancy: projection of the same point looks the same in every frame
  - Small motion: points do not move very far
  - · Spatial coherence: points move like their neighbors

CMPSCI 670

Subhransu Maji (UMass, Fall 16)

# The brightness constancy constraint

Brightness Constancy Equation:

$$I(x, y, t-1) = I(x + u(x, y), y + v(x, y), t)$$

Linearizing the right side using Taylor expansion:

$$I(x, y, t-1) \approx I(x, y, t) + I_x u(x, y) + I_y v(x, y)$$

10

Hence,  $I_x u + I_v v + I_t \approx 0$ 

CMPSCI 670

9

Subhransu Maji (UMass, Fall 16)

# The brightness constancy constraint

- How many equations and unknowns per pixel?
  - One equation, two unknowns

$$I_x u + I_y v + I_t = 0$$

• What does this constraint mean?

$$\nabla I \cdot (u, v) + I_t = 0$$

• The component of the flow perpendicular to the gradient (i.e., parallel to the edge) is unknown

# The brightness constancy constraint

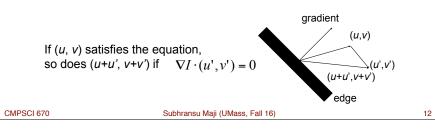

- How many equations and unknowns per pixel?
- One equation, two unknowns

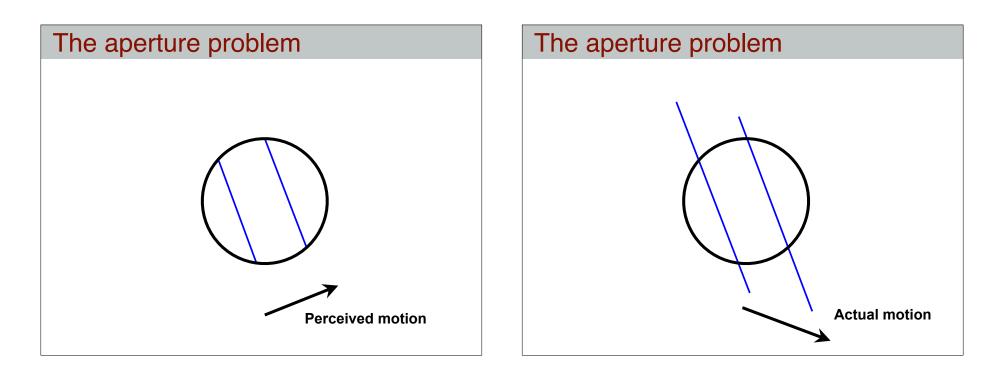

$$I_x u + I_y v + I_t = 0$$

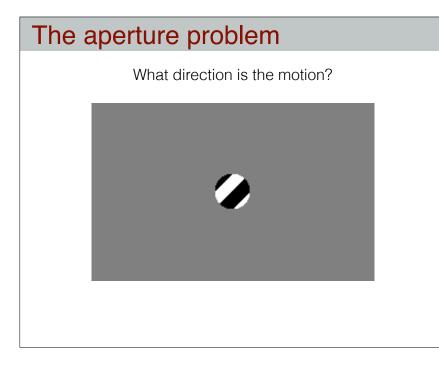

What does this constraint mean?

$$\nabla I \cdot (u, v) + I_t = 0$$

• The component of the flow perpendicular to the gradient (i.e., parallel to the edge) is unknown

# The barber pole illusion Image: state of the barber pole illusion Image: state of the barber pole illusion http://en.wikipedia.org/wiki/Barberpole\_illusion

# Solving the aperture problem

- How to get more equations for a pixel?
- Spatial coherence constraint: pretend the pixel's neighbors have the same (u,v)
  - E.g., if we use a 5x5 window, that gives us 25 equations per pixel

 $\nabla I(\mathbf{x}_{i}) \cdot [u, v] + I_{t}(\mathbf{x}_{i}) = 0$   $\begin{bmatrix} I_{x}(\mathbf{x}_{1}) & I_{y}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) & I_{y}(\mathbf{x}_{2}) \\ \vdots & \vdots \\ I_{x}(\mathbf{x}_{2}) & I_{y}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{t}(\mathbf{x}_{1}) \\ I_{t}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{1}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{2}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{2}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{2}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_{x}(\mathbf{x}_{2}) \\ I_{x}(\mathbf{x}_{2}) \\ \vdots \\ I_{x}(\mathbf{x}_{2}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \end{bmatrix} \begin{bmatrix} u \\ v$ 

 $\begin{bmatrix} I_x(\mathbf{x}_n) & I_y(\mathbf{x}_n) \end{bmatrix} \begin{bmatrix} I_t(\mathbf{x}_n) \end{bmatrix}$ B. Lucas and T. Kanade. An iterative image registration technique with an application to stereo vision. In Proceedings of the International Joint Conference on Artificial Intelligence, pp. 674–679, 1981. # Lucas-Kanade flow

- Recall the Harris corner detector: M = A<sup>T</sup>A is the second moment matrix
- We can figure out whether the system is solvable by looking at the eigenvalues of the second moment matrix
  - The eigenvectors and eigenvalues of  ${\bf M}$  relate to edge direction and magnitude
  - The eigenvector associated with the larger eigenvalue points in the direction of fastest intensity change, and the other eigenvector is orthogonal to it

# **Optical Flow Results**

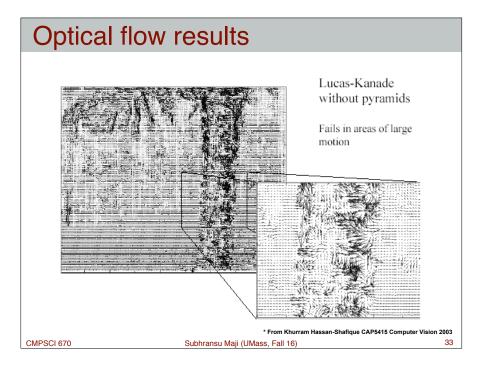

# Errors in Lucas-Kanade

- The motion is large (larger than a pixel)
  - Iterative refinement
  - Coarse-to-fine estimation
  - Exhaustive neighborhood search (feature matching)
- A point does not move like its neighbors
  - Motion segmentation
- · Brightness constancy does not hold
  - Exhaustive neighborhood search with normalized correlation

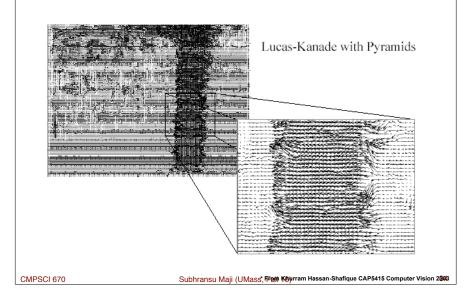

# Multi-resolution registration

CMPSCI 670

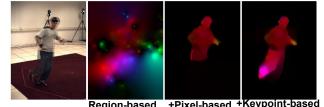

# **Optical flow results**

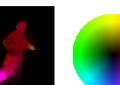

# State-of-the-art optical flow

Start with something similar to Lucas-Kanade

- + gradient constancy
- + energy minimization with smoothing term
- + region matching
- + keypoint matching (long-range)

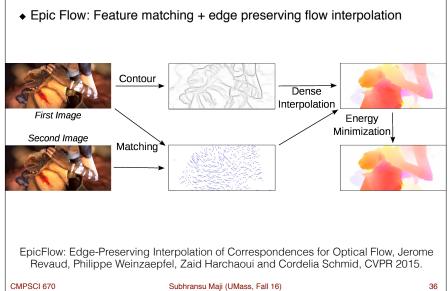

Region-based +Pixel-based +Keypoint-based

# State-of-the-art optical flow

# Feature tracking

- So far, we have only considered optical flow estimation in a pair of images
- If we have more than two images, we can compute the optical flow from each frame to the next
- Given a point in the first image, we can in principle reconstruct its path by simply "following the arrows"

# **Tracking challenges**

- Ambiguity of optical flow
  - Need to find good features to track
- Large motions, changes in appearance, occlusions, disocclusions
  - Need mechanism for deleting, adding new features
- Drift errors may accumulate over time
- Need to know when to terminate a track

CMPSCI 670

Subhransu Maji (UMass, Fall 16)

# Shi-Tomasi feature tracker

- Find good features using eigenvalues of second-moment matrix
- Key idea: "good" features to track are the ones whose motion can be estimated reliably
- From frame to frame, track with Lucas-Kanade
- This amounts to assuming a translation model for frame-to-frame feature movement
- Check consistency of tracks by *affine* registration to the first observed instance of the feature
  - Affine model is more accurate for larger displacements
- · Comparing to the first frame helps to minimize drift

# Tracking example

Figure 1: Three frame details from Woody Allen's *Manhattan*. The details are from the 1st, 11th, and 21st frames of a subsequence from the movie.

Figure 2: The traffic sign windows from frames 1,6,11,16,21 as tracked (top), and warped by the computed deformation matrices (bottom).
